

SME Bank Models

Bottom-up unit-economics workbooks for a synthetic UK SME bank, provided for reference use. Every figure is synthetic or from cited public sources; nothing here describes any real institution's internal data.

File	What it is
<code>UK_SME_Bank_Bottom_Up_Unit_Economics.xlsx</code>	The reference model: 9 tabs, ~600 live formulas, from customer bounding through per-product economic profit, plus a flow register.
<code>meridian_model.xlsx / .xls</code>	A second worked example at a smaller scale ("Meridian", fictional), built from the same method. <code>.xls</code> is the legacy-format copy.
<code>meridian_fact_pack.md</code>	The synthetic input data behind the Meridian model, including how missing inputs were flagged and banded.

How to use with an AI assistant

- Download the workbook (binary — do not copy code or cells via the clipboard) and open it in Excel. All formulas are live and recalculate on open.
- Ask your assistant to ****replace the values on the Inputs tab with your own numbers, one section at a time**** — every input is a single labelled cell with a source note.
- The built-in check: the bridge-check cell on the Unit Economics tab must stay at ~0 after every change. If it moves, structure was broken — undo and retry.
- Record every edit on a change-log tab you add — the workbook is the model, so its audit trail matters.
- Structural changes (adding or removing products or cost lines) go beyond input replacement — follow the row and column patterns already present, and verify the bridge check still holds.
